

14710 Pole Cat™

Purpose:

This product enhancement accessory is intended to improve the grip of the high power light source on vertical members, such as the light support bar of a ripple tank.

Procedure:

Prepare the light source for installation. By grasping the spring clamp in the usual way, try to squeeze the padded jaws wide enough apart to be able to grip the vertical support. Do not install it at this time. Relax the clamp.

Place the Pole Cat™ against the padded jaws so that both dowels protrude through both padded loops of the clamp.

Holding the Pole Cat™ in this position, spread the jaws again as before, but this time introduce the top of the vertical support between the jaws and between the dowels. When finished, the top dowel should be behind the vertical support and the bottom dowel should be in front of it, as viewed from the socket and lamp. The figure will help make this clear.

Now the clamp can be easily raised or lowered without losing the grip on the vertical support, and pushing down on the lamp socket will not tear the clamp from the vertical support.
